Country Beta has faced protracted community violence, political instability, and natural disasters like droughts and floods, which have significantly impacted its healthcare infrastructure and services. As a result of these combined factors, many healthcare facilities in the country are either non-functional or partially operational. This has led to limited access to basic healthcare services for a vast majority of the population. Surgical care is mostly absent from the rural areas of Beta with the exception of the trauma care offered by international NGOs. Furthermore, Beta has a high burden of infectious diseases such as tuberculosis, cholera, and measles. The immunization coverage remains low, leading to periodic outbreaks of preventable diseases like polio and measles, particularly in rural areas.

Inadequate access to clean water and sanitation facilities has contributed to recurrent outbreaks. The country has one of the highest maternal mortality rates in the world mostly due to the inadequate access to maternal health services, skilled birth attendance, obstetric surgery and family planning.

International organizations and NGOs play a crucial role in providing health services, especially in remote and conflict-affected areas. However, access can be hampered by security concerns, particularly with the increasing reliance on tribespeople to ensure law and order in some of the districts.
